

your home design

We love our large windows and bringing nature in to view all four seasons is a collective treat. The only downside is the sun in all its glory does what the sun does naturally – fading almost everything it touches. Here are two suggestions to minimize the fading, damaging and costly repairs.

Investigate solar shades; they are like sunglasses for your windows, making them the perfect solution for minimizing glare from the sun and controlling indoor temperature. Available in different openness factors, these shades gently diffuse natural sunlight, block harmful UV rays and keep rooms cooler. Their simple yet streamlined appearance complement any décor or style. And I suggest having motorization or sensor control for your very large floor-to-ceiling views.

Another option is home window tinting. Window film filters can significantly improve energy efficiency. The amount of energy savings achieved per household depends on the window film used, the building construction and the climate in which the building is located. It is designed to virtually eliminate ultraviolet radiation, the main cause of fading.

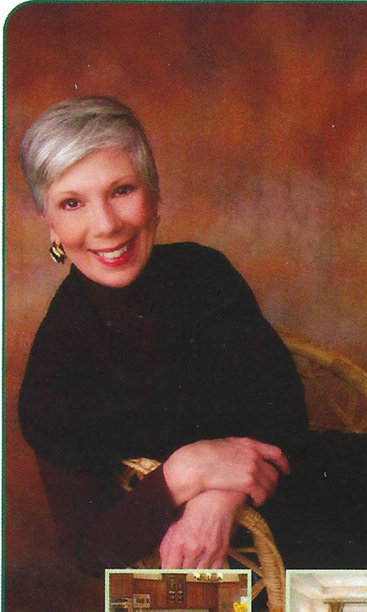

Both options offer great value in that you have great energy savings and protect your carpet, furnishings, hardwood floors and artwork from premature fading all while still enjoying the view outdoors. Let me know how I can help.
